

## Forward

Before I begin, I believe this is my life's work and it is my belief that it can be a stepping stone to something far larger than just the sum of its parts.

I have never been a particularly talkative person, but when I do speak I try to say as much as I possibly can without leaving my audience feeling like I am wasting their time or talking down to them. Sometimes in the journey to find the balance between efficient transfer of an idea and providing the requisite references so that the intended recipient can comprehend that idea.

Drawing on a number of expertise areas that have no rightful reason to be on the same resume, it is important to remember that there are a few key ideas to keep in mind when understanding what follows.

## INTRODUCTION

This is intended to be a series of discussion essays to illustrate what I am calling, "The Orion Philosophy." Etymology aside, Orion is has been my online name since I became an adult.

First, it might be prudent to explain a bit about what precisely is going to be discussed.

1. Ideas are the topic of discussion. As such, no Idea is off limits. That being said I will attempt to be as sensitive as I can be while demonstrating my point. Just wait until the essay on Censorship... I will explain the Idea as a term, cite an example, and then explain how it connects to the Orion Philosophy
2. If examples are used to illustrate an Idea I will rely on you to do your own research so do not expect direct citations unless the idea requires that sort of clarification.
3. I will be attempting to examine each Idea from a variety of perspectives. This means that I will also try to make the best possible argument for and against each idea.
4. These essays are intended to be like pieces in a puzzle, meaning that you can get a small picture of the overall Orion Philosophy in my final essay. As long as you read this chapter first, and the last chapter last, you can choose any order you wish to read in, skip topics you are not comfortable with, or are too complex for the time you have to consider it. Don't try to read this in one day. Let it unpack in your mind.
5. After this series of essays is published, I will also be using this as a reference material for discussions, venue to be determined.

Now to the part that a good journalist is looking for: What is the Orion Philosophy?

UNDERSTANDING is only achieved by vigorous dialectic, confrontation of IDEAS and

differing PERSPECTIVES, and seeking the "OBJECTIVE" view. Ask the questions. Challenge the assumptions. Determine which details are important, and which are noise. Finally, never stop learning.

With that out of the way, please enjoy the essays. I look forward to hearing all about how wrong I am about everything. Cheers!

## CHAPTER 1 PERSPECTIVE

I'm not going to make you do the eye test to explain perspective. That would be too easy. Instead, I will define what perspective means from my own perspective. Perspective is a single point of view. Now that I think about it... Maybe that wasn't much harder...

A good general can make good decisions with bad information even as long as the general knows how and why his information is wrong. In the fog of war, it is difficult to know exactly what has happened across an engagement zone no matter how much intelligence you possess. There is simply too much going on. But you of course do have ways to receive and sort information but you need to know everything else about that information too. This is the concept of Metadata. Information about information.

You can probably imagine how difficult it would be to catch a fly with only one eye open. Ideas are much like the fly, in that with your one eye connecting with the fly is not exactly the simplest task.

My father, Brad, whom I loath, was wrong about an awful lot of things. Sometimes it took me longer to figure that out than others. I did however also learn a lot from him as well. One time, he told me about the time he participated in the Berkley Free Speech Riots. More recently, however, it seems to me that the students of Berkley are more interested in orthodoxy than hearing perspectives outside of the dictates of their preferred guru today. This would be my perspective about the 2016 Berkley Campus Riots, but you could name any other student movement you wish. The pattern seems to fit.

From my perspective, I could not possibly hope to know all of the motivations of all of the people involved. Thus, I am prepared to be wrong. But, until I have the data I need to prove that hypothesis, I must also know that it is limited. Perhaps, I am missing the forest for the trees.

## CHAPTER 2 RATIONALITY

What is rationality?

In it's most distilled form rationality is the use of reason to derive a desired solution. In other words I could also describe it as the reasons associated with a solution.

If one were to consider the reasons of why a solution was done in a certain way.

Once the reasons for a solution are derived, I can in turn exploit those reasons to in turn

develop a new solution.

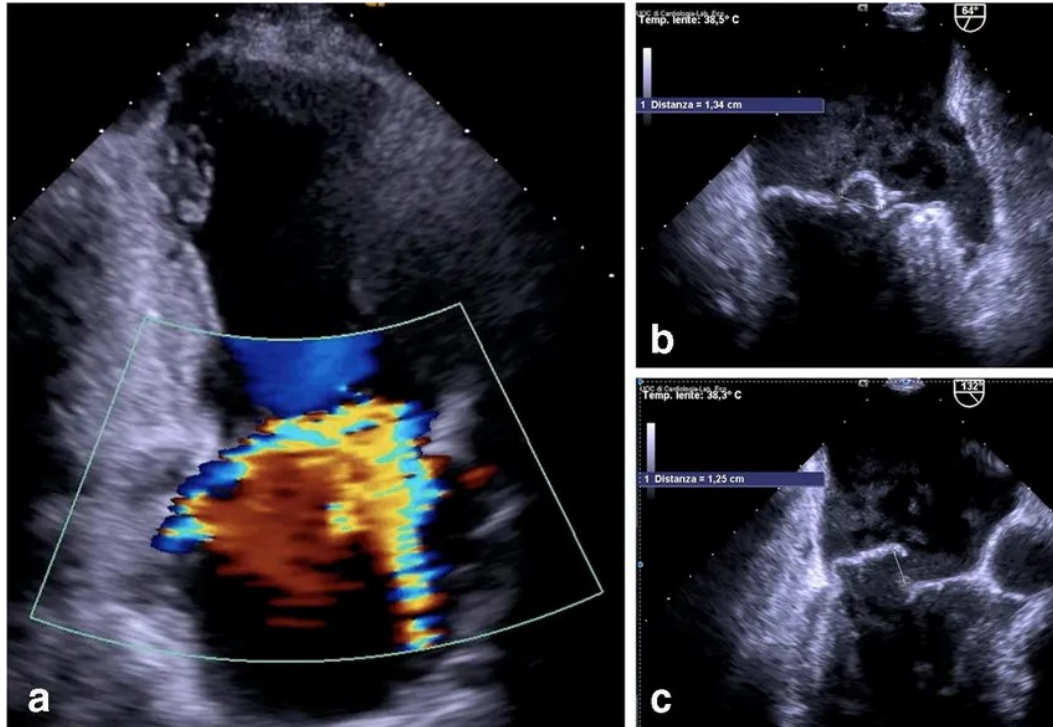

With the idea of a financial spreadsheet. What are the reasons I could associate with a the financial spreadsheet. The spreadsheet was made in order to make it easier to understand vast ocean of financial information. By breaking it down to a subset of all the data that is the ocean of financial information.

Now that I have the reason that something was made, I can now examine how the financial spreadsheet was made. This is a bit more tricky, because there is a lot of debate over where the line is between taking the that information and using it elsewhere. So, instead of simply reverse engineering something, I am looking specifically at the reasons of the method, not the method itself.

Consider the perspective of an Air Traffic Controller who has been told by an aircraft at night that there was an unspecified emergency onboard their aircraft and that they need to land immediately. What are the steps involved in this process? What is the desired result?

From personal experience, it would be best to clear my airspace and airfield of all possible hinderances of the task at hand. What are the steps involved?

I must have someone tell all vehicles on the ground to get out of the way, and I must also clear all of the other non-emergency aircraft from the domain of my airspace. Using the process laid out in the 7110.65, I can do these steps thoughtlessly. In essence, the words of the procedure have become a tool through repetition.

I don't think that it is wise to do this with every idea. There are some things am simply not equipped to control. I can, therefore I must.

I once lost my job for a variety of bullshit reasons and I had finally had enough of it. I hated the idea of what I had to do in order to survive. I hated the fact that I couldn't change jobs, because my ID had been stolen while I was doing my job advertising. Door to door, at night, putting those fliers on everyones doors. It had all been building up for weeks and weeks in Phoenix, both the heat and my stress levels. My boss would never give me the answers I needed to do my job. If I had known his reasons, perhaps there was a solution. But now, I will never know.

## CHAPTER 3 LOGIC

What is logic?

A method for analyzing an idea through process and reason. What are some example of this? If I were to consider a simple equation  $1 + 1$ , I could say that if one is added to one, then there is a result.

Now I can consider other things following the pattern provided by logical analysis. A series of statements in the process of developing a solution.

In English, the statement " $1 + 1$ " could be stated as one added to one.

Media Source:

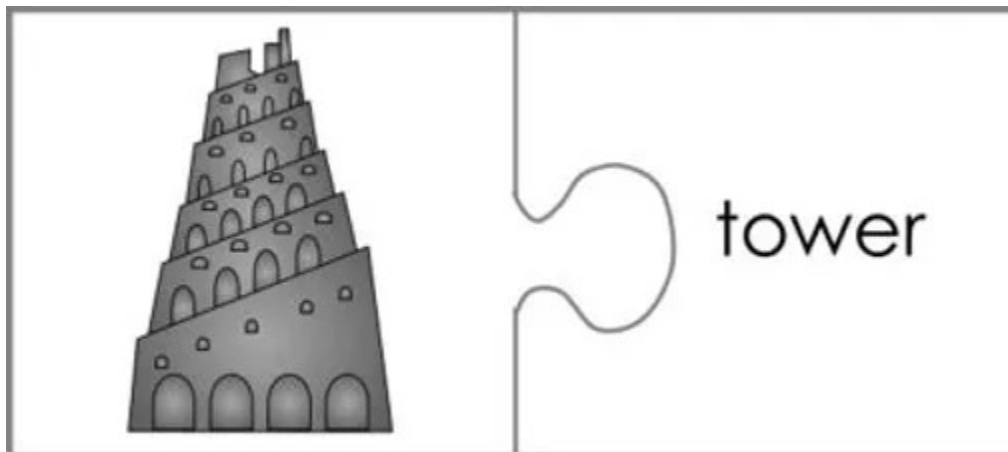

<https://youtu.be/O4ndIDcDSGc>

One excellent example, is Gödel's Set. In a nutshell, Gödel's Set is an attempt to prove that math is complete, consistent, and predictable.

What if the set I used were not Gödel's set? Could it fulfill the requirements of being complete, consistent, and predictable? I don't think it's likely, but I think it is possible.

Another set that I find fascinating is the Tower of Babel. <https://github.com/yosuke-furukawa/tower-of-babel> in this example, I could say that all English words are contained within the idea of the tower of babel. Based on that assumption, I could also say that the set that is the Tower of Babel is complete if and only if all words in the English language are in the Tower of Babel.

## CHAPTER 4 OBJECTIVITY

How are ideas validated?

Suppose I have been exposed to a new idea. How do I know whether or not that idea is good or bad? In other words, is the information valid?

Let's consider a story that our buddy down at the bar told us.

According to our friend whom I have known since childhood, tells us a story about a

certain dining establishment in which they do terrible things to some group that is particularly vulnerable. Well this story is of course outrageous, how could those awful people do those things to that protected group?

Media Source: Bar Stool

<https://imgs.search.brave.com/bgvaNsXWA6t9XcAlN0kreJPKz0y4huJnuWvUBEroa78/rs:fit:610:225:1/g:ce/aHR0cHM6Ly90c2U0/Lm1tLmJpbmcubmV0/L3RoP2lkPU9JUC5U/dEFzLTYwM2d1c21u/cWdDQnZYVZBSGFz/dyZwaWQ9QXBp>

I'm willing to bet you can spot the flaws with any answer I could possibly give to that question. Why? First I need to distill the story into ideas that I can understand so that I can evaluate them against our current understanding.

What are the perspectives in the story? I have our perspective of hearing it from our friend. We have our friend's perspective. We also might have the perspective of someone who told our friend about it. Is it possible to distill an objective perspective from those perspectives? No. There is simply not enough information.

I can also evaluate the trustworthiness of each link in this chain of perspectives. My friend may have told us the source of his information, and so I could also evaluate the trustworthiness of that perspective. I have no way of knowing how long this chain of information is, so how do I determine the validity of the story? I really can't unless I test it.

Media Source: Math

<https://imgs.search.brave.com/XvFHKh1xg9NBCW4VV6vwOwff9kU2xFPahCunkL3X80Y/rs:fit:948:225:1/g:ce/aHR0cHM6Ly90c2Uz/Lm1tLmJpbmcubmV0/L3RoP2lkPU9JUC5K/OFlnc1VjRTY5VE1D/d3V3NE1ZdU9nSGFE/dCZwaWQ9QXBp>

Does it meet your expectations of the groups involved? Perhaps. Does it fit the pattern too well? Perhaps, the information is entirely fabricated to fit the pattern we see. This would be the idea of data integrity. Choose any data set you like, can you follow the links in the chain to verify the validity of the data. Is the perspective you are seeing in the data accurate to the information that you can verify? What are the motivations involved in the data you are seeing? Is there a better perspective?

In order for an idea to be objectively understood, it must be consider it from more than a single perspective.

## CHAPTER 5 SYNTHESIS

How do we use the ideas we already have to understand new ideas?

Once an idea is understood in terms that we understand, we can apply them to our existing knowledge base. In data management terms, this would be mapping data points.

Now a practical example of doing one such thing. Suppose I am sorting columns of data in a table. If you reframe your problem more generally as, "what precisely am I doing with my sorting function."

One column of data could be a list of city names, the second column could be a list of items in those cities. Each set could be said to contain the all of the ideas associated with both the names of each city, the ideas associated with the items in the list of items in those cities, and a direct relationship between the city name and those items.

Where would I look to find information on busses in those cities? I would essential be sorting the first list, by the lists in the second column that contain the item, "bus." The resulting subset of the both columns is the answer to our initial question.

## CHAPTER 6 PRINCIPLE OF UNDERSTANDING

Why understanding is important?

Conflicts in data often arise because of differences in the terms used to describe data sets. In terms of social interaction, this can also cause conflicts. One example of this

could be a border dispute between nations.

The core reason for this conflict could be anything. But the solutions to that conflict cannot be determined until each side understands the goals and motivations from the other side's perspective.

If I were to use a more concrete example, I could look at Ghingis Khan's conquest of most of the Asian Continent, and parts of Europe. What made his conquest so remarkable? He used what he understood about what he know, determined a course of action, and had a unifying purpose. Once the warring and conquest was over, what happened to his empire? It dissolved into internal conflicts in part because each member of the empire believed that they had the correct answers.

My lovely future wife has also reminded me that changing the words used can be the first attempt to lower anyone's defensive walls. In practice, the focus on tone of speech can actually decrease the level of understanding possible. While it is still important to hear the tone, perhaps it would be more wise to connect that tone to one of their motivations.

In my own experience, my tone has often been interpreted as anger while in is instead because of something else going on with me personally. For example, I was chatting about ideas with my muse and she seemed to think that I was angry at her. That could never be the case, of course. There are very few things she could do or say to actually anger me. Instead, I had forgotten to eat that morning and I was hangry. I didn't realize it until after the conversation though.

## CHAPTER 7 PRINCIPLE OF SYNERGY

How do ideas work together?

When solving problems I have a very muddled approach. Because of the terms that I use to define a problem, I have learned a lot about making ideas work together. In data, one of my favorite ideas to think about is water systems. I want the product of my current task to be completed. In my garden that would mean monitoring the PH, making sure the sprouts are not dying... When I think about data, I can use what I have learned about how my hydroponic system. I can ask the same type of questions that system as well.

## CHAPTER 8 CHAOS THEORY

What to do when there is simply too much information.

It is a hazard of exploring ideas in this way, that inevitably the amount of information will outweigh my abilities to deal with them. I can't just look and feel my way out of the problem. My problem in this situation is that I don't know what data I need. My answer could be lying in weight in the mountains of data. I need to ask the right questions. What is my desired result from this analysis? What assumptions can I make that will

help narrow my possible results?

## CHAPTER 9 GAME THEORY

What is the goal of a game? What are the motivations for playing a game? Is there a way to achieve a mutually beneficial outcome between what you want from the game, while fulfilling your motivations for playing the game?

It would be rational to assume that if one were to play a game, they would want to win the game. The game has a set of rules to define what winning in context of the game. As a player, you have a motivation for playing the game because it fulfills your goals.

What is the relationship between getting the desired results of winning the game, and your own personal goals?

Media Source: Yugioh

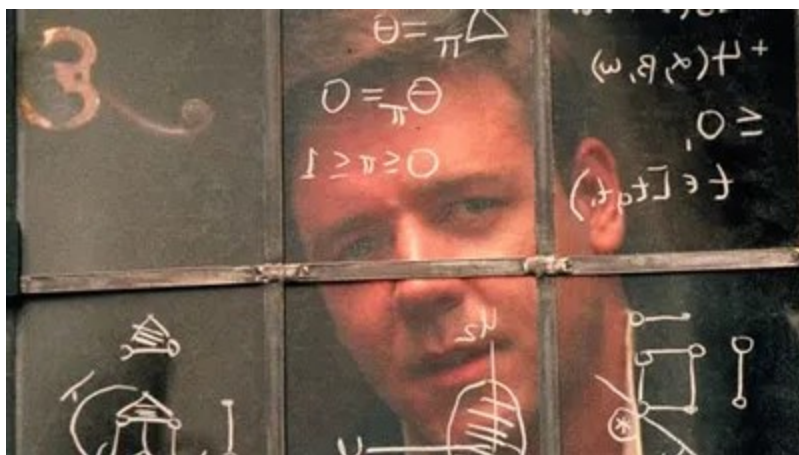

<https://imgs.search.brave.com/zF1r4kebh5ZMeHGhRhG3zvwQKGnxGiG83B6bNyc212g/rs:fit:338:225:1/g:ce/aHR0cHM6Ly90c2Uy/Lm1tLmJpbmcubmV0/L3RoP2lkPU9JUC5Z/YTk5THZTSEM4aOU2/OUdhNktnYS1RSGFL/WSZwaWQ9QXBp>

I suppose that our game of choice is one that has an high skill curve, the mechanics of the game fulfill a desired skill set I wish to develop, and I want to maximize the amount of time I put into the game. In order to derive my desired outcome, I need to ask the questions: How much do I need to learn in this game? What are the skills that I have that apply to this game? Are there any nuances to this game that I need to be aware of? Is my end goal to become a professional at this game? What are strategies employed in this game that will help me win?

In answering these questions, I could say, I want to make this my job. Full time streaming, professional with sponsors and everything. I want to invest about 40 hours a week into playing this game in order to build the skills required to get to the professional ability that I need. From these answers I can figure out how long it would take for me to become good enough at the game to be considered professional material to any sponsor. From this I could in turn determine how long it would take for me to grow a business based around the idea of playing a video game.

What are the implications of this decision I am theoretically making: To play video games professionally? It means that perhaps after a time I will grow bored with the game and seek to move on, or in the worst case it could lead to me hating my hobby that I have loved for so long to become a chore. Therefore, it is not in my rational self interest to play video games, if I decide that I do want to continue playing video games in general.

## CHAPTER 10 NUMBER THEORY

If I ask the question: What are numbers? Numbers could be defined as representative symbols of an arbitrary but defined quantity. The symbol of a number is not important, the underlying idea being described is what gives numbers their meaning. Or, if put another way I could say that numbers have no meaning without context.

So a set of numbers without meaning, when devoid of context. This is the idea of a set. Sets are defined by the properties of the parts that compose them.

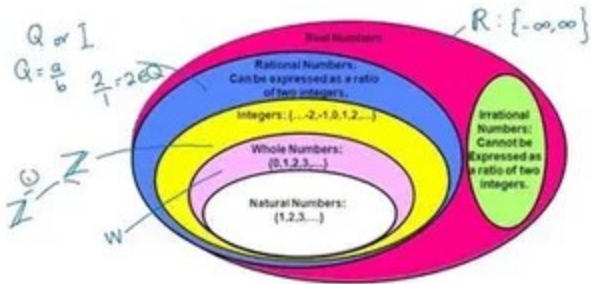

When I compare it sets to each other I can use the definitions to define the differences between the sets, and the similarities. Using this technique I can in disregard everthing about the sets except what they have in common. Is there a connection between the sets? Yes. Is that connection important? Possibly.

By defining our terms, I can analyze any set against any other set. This is a core principle in set theory.

## CHAPTER 10.1 SET THEORY

Set theory could be described as the analysis of sets using the traits inherent in the set. Details of a set can now be describe as indexes. Using the indexes. By comparing the indexes for matches in patterns, a result can be extracted. I'm interested in the idea of infinite undefined sets in particular.

A common problem that mathematicians often face is the sort of problem that can't be solved by simply comparing the actual sets against each other without some additional context. A popular application of one such set theory is the  $3n+1$  family of sets. I think there is a relationship that could define the sets.

## CHAPTER 11 DYNAMIC SYSTEMS

I like to imagine the idea of a computer as a stack of skateboards. With each skateboard stacked one on top of the other. The concrete floor representing the underlying the foundations of quantum physics. Each skateboard in this stack is representative of each component layer of the computer. So, after the cement floor, the first building block for a computer would be the quarks of each boson, that compose the computer.

I can carry our analogy of a skateboard forward to the evaluation of data as an idea. Where in this stack of skateboards is there data? Well obviously, the skateboards have the data. Where else could there be data? The component parts of each skateboard would have data associated it as well. This in data science terms would be the idea of metadata.

## CHAPTER 12 NUANCE VS DISTINCTION

If nuance is described as the minute differences between two terms, then I could also say that the distinctions are the differences between the two sets.

A code of symbols is defined as the symbols contained within a set.

By using the terms when defined by symbols, I can derive the nuances that make the important distinction.

## CHAPTER 13 PATTERN RECOGNITION

"There could be a mathematical equation for how bad your tie is." John Nash - A Beautiful Mind 2001

I am a humble novice in experience about pattern recognition. I can see some patterns, but not others. I can only see what I am looking for. The idea I want to test is: Is there a pattern to the frequency of instances of a word being used and how many times fights occur between married couples? I want to study this relationship but my dataset is incomplete. I have a few assumptions and I need data.

1. I will define words being used by a particular quality that I am looking for. In this case, "conflict words."
2. I will compare the rate of usage of conflict words I have defined and then I can compare that set against the language performance from the example of the Tower of Babel because it is a complete set of all English words to determine if there is a relationship between the "health of a society" as described in Chapter 16.2.

The result of this analysis in English would be the product of my assumptions and the information I have been able to extract.

## CHAPTER 14 ETERNALISM

What is the eternalist perspective?

In data science terms, time is considered as a ratio of segments of time using a the age of the universe. The universe is so vast that numbers alone cannot describe what those.

## CHAPTER 15 SELF CONTROL AS A FUNCTION OF SURVIVAL INSTINCT

When is it appropriate to take action to end a threat?

In considering writing this bathroom book, one of the many things I needed to consider was: If I had to could I defend myself, would I? I can now say, yes. I will defend myself because I must defend myself.

## CHAPTER 16 BIOLOGICAL PERSPECTIVE ON SOCIETY

Evolution strategies (K type, S type)

In biology, there are two types of evolutionary strategies. The first, I will refer to as K type, is to have few offspring and care for them long term. The second, S type, is to have as many offspring as possible while caring little for the resulting offspring.

### The *r*-*K* Scale of Reproductive Strategy: Offspring Numbers

<https://ib.bioninja.com.au/options/option-c-ecology-and-conser/c5-population-ecology/r--k-strategies.html>

If I were to consider both strategies in data science terms, I could say that one strategy was spending more energy on each offspring, and we could indeed quantify the resulting success of each generation to verify if that method was working. In K type strategies, the resulting offspring would inherit more behaviors from their parents. In data, this would be the property of inheritance.

Media Source: Family Tree

We could then look at the genetics of each genetic generation to determine which characteristics are possibly inherited through this route or if it was inherited through nurture. Such studies have been performed, despite the ethical considerations of the particular methods used, and from these we can learn statistically which strategies are the most effective, and which are the least effective.

## CHAPTER 16.1 ETMOLOGICAL PERSPECTIVE ON SOCIETY

"The words you use will become the rods that are shoved into your backs." - Carl Benjamin

If I have learned anything from observing contemporary politics: If you do not define the terms you use, your enemies will. Once this happens, it is extremely difficult to change the ongoing conversation because most in most circumstances, the every media source they turn to is using the words and the definitions that were created by one side or the other.

Media Source: CNN

One of the hardest things to deal with when reading a historical document, for example, is understanding the words on the page and the meaning of those words in the context of the time in which they were written.

Media Source: Conquest of Asia Map

To some extent the record of meaning has been consolidated, distilled, and refined into a variety of source books for a language. From these records we can derive the underlying meaning of a text, but we can not hope to understand the ideas of the text without the appropriate perspectives of the period in which they were written. From this we could say, over time the changes in language are determined by how they are used in the societies in which they are found.

Media Source: Language Tree

<https://imgs.search.brave.com/EHyT9Fmeo5RZBMfiyneFQ ATHg6zRxxVF4FVjzSsNBs/rs:fit:791:225:1/g:ce/aHR0cHM6Ly90c2Uz/Lm1tLmJpbm cubmV0/L3RoP2IkPU9JUC41/cENLRG5XUS1nNXBs/V29OY3hkvi9BSGFF/YyZwaWQ9QXBp>

Some languages also have nuances that cannot be conveyed by words alone. One example of this would be a tonal language such as Traditional Mandarin. You can analyze the meaning of the idea more directly because it is literally spelled out in the symbol. But that is not an indication of any intention on the part of the user of that language. There is a depth to language that can be quantified by the amount of nuances

that can be contained within it.

Media Source: 我愛我的愛人 (Google Translate)

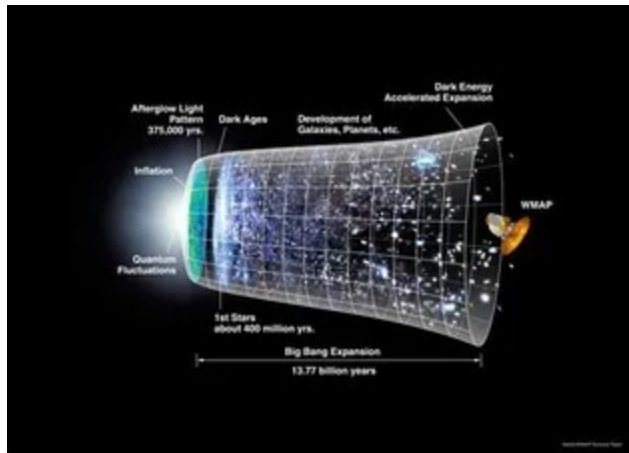

If we were to define this as a data science term, this would be the efficiency of the language. In this arbitrary calculation, we can define each term of this as some ratio between the amount of meaning that is typically conveyed, and the maximum amount of meaning that can be conveyed by the most compact example.

Media Source: Financial Charts

Now using those same ratios we can also compare between different languages. Which one is the most efficient? We need to account for those ratios, which could be considered as the average efficiency of the normal user of the language, and the maximum usage of the language. We can also use these ratios to compare how those languages have evolved over time.

## CHAPTER 16.3 NOTES ON LANGUAGE

Just because I am paranoid does, necessarily I am not being stalked.

Perhaps because of my speech impediment, I have always searched for words to use in place of other words so that I could conceal it.

Of this personal interest, I learned to love language, but not in the same way that most would imagine that passion to go. I always wanted to learn a foreign language, but moving around so much. I was hardly able to keep up with the local slang of every grade school I was in this year. I did however, upon occasion, find the gem schools. The ones that put purpose into the planning of students. Some schools would focus on different areas, while others would focus on others that they thought more important. So I was exposed to a vast array of not only the individual lessons, but on some occasions I also went to a school in the same year that was at a different part of the state mandated curriculum. If I were to give this a term, it would be different schools of thought.

Assuming the politics and agendas of the day involved in those decisions, it allowed me to see a lot of different perspectives on a lot of different subjects. Essentially, one could even say that my entire primary education was not unlike a puzzle.

## CHAPTER 21 THE ROLE OF A FAMILY

My family's role is to keep my feet on the ground.

## CHAPTER 22 LOVE

Some might say that the idea of love is an irrational response to external stimuli. I would disagree. I think love is an evolutionary counter to selective pressures. How do I prove my hypothesis? I need data, but that's not the kind of data one would have lying around in a database unless they some motivation behind the use of that data.

I don't think it would be a good idea if I were to compile data on the topics. What good faith use could I have for this kind of data? I can come up with none.

One example of this was from a recent discussion with some people with a lot of good ideas. Most were appalled at the idea of what my tool could possibly do. I'm glad that some thought it was a good enough idea to persue. When my tools are used it will be with the intention to solve a specific problem. Nothing more, nothing less.

## CHAPTER 23 RELATIONSHIPS

What is the purpose of relationships in societies?

Considering that a society is more than the sum of the members, what is the relationship between the members of a society and the society?

One relationship is a parent child relationship. Eventually, that relationship, a properly functioning relationship when compared to the expectations of society would turn into a relationship of friends as well. I have made 2 possible relationships between the members in a society.

Based upon the subset of data that I have about the society, I can determine the ratio of successful relationships in that society, and could define success by any parameter I want. The question I want to answer, in a nutshell is, "Which societies are the most successful?"

## CHAPTER 25 THE ORION PHILOSOPHY

What is the Orion Philosophy?

I don't want to waste anyone's time.

I don't want to waste words because they are not something to be abused.

I either do or do not want to ask questions.

I don't know what questions.

Does that matter? Not really.

I can use the tools I have assembled over time to dissect a problem, distill the underlying causes of a problem, and determine solutions.

The only thing I need to do is to ask the right questions.

If one were to ask me what I thought about God, I know when I made the judgement I made, and why I made that judgement.

If one were to ask me about what I thought about my role in society, I can tell them exactly what I think that is.

I just want people to ask the questions.

I can tell you about why I think I'm a pirate with a cause.

#### AFTERWORD

With all of the tools assembled that I can provide, I'd like to show you my idea and I think it is beautiful. To answer the question I posed to The Bar: What does Orion Agappe mean? To me it means, that I am The Person to find your solution because I love ideas. Thank you for your time and consideration.

Respectfully,
